Modern Concepts and Theorems of Mathematical Statistics

Springer Science & Business Media With the rapid progress and development of mathematical statistical methods, it is becoming more and more important for the student, the instructor, and the researcher in this field to have at their disposal a quick, comprehensive, and compact reference source on a very wide range of the field of modern mathematical statistics. This book is an attempt to fulfill this need and is encyclopedic in nature. It is a useful reference for almost every learner involved with mathematical statistics at any level, and may supplement any textbook on the subject. As the primary audience of this book, we have in mind the beginning busy graduate student who finds it difficult to master basic modern concepts by an examination of a limited number of existing textbooks. To make the book more accessible to a wide range of readers I have kept the mathematical language at a level suitable for those who have had only an introductory undergraduate course on probability and statistics, and basic courses in calculus and linear algebra. No sacrifice, how ever, is made to dispense with rigor. In stating theorems I have not always done so under the weakest possible conditions. This allows the reader to readily verify if such conditions are indeed satisfied in most applications given in modern graduate courses without being lost in extra unnecessary mathematical intricacies. The book is not a mere dictionary of mathematical statistical terms.

Statistical Tables for Multivariate Analysis

A Handbook with References to Applications

Springer Science & Business Media An English translation of my "Statistische Tabellen zur multivariaten Analysis - Ein Handbuch mit Hinweisen zur Anwendung" was planned already in 1975 when I prepared the German volume. The tables were immediately supplied with German and English headings for the intended photo-offset printing. In the meantime, new and important tables for multivariate statistical hypotheses and procedures have been compiled and published. Only four of them have been incorporated in the present volume. The selection of these tables must be on an individual basis for reasons of space. Let me mention only the new tables for sample size determination in MANOVA. The instructions for using the tables are all organized in the same way. They are kept short since it is not the task of such a work to provide an introduction to the theory and practice of multivariate analysis. I have renounced giving examples for the same reason. I wish instead to refer the reader to the many good textbooks that are available, as well as to my own works on methods that are in preparation. Furthermore, I am of the opinion that statistical tables should accompany the textbook rather than be included in it. viii Finally, my thanks go to the translator, Mr. Peter R. Wadsack, as well as to the ladies and gentlemen of Springer-Verlag for their pleasant collaboration and their indulgence of my numerous requests

The Collected Works of Wassily Hoeffding

Springer It has been a rare privilege to assemble this volume of Wassily Hoeffding's Collected Works. Wassily was, variously, a teacher, supervisor and colleague to us, and his work has had a profound influence on our own. Yet this would not be sufficient reason to publish his collected works. The additional and overwhelmingly compelling justification comes from the fundamental nature of his contributions to Statistics and Probability. Not only were his ideas original, and far-reaching in their implications; Wassily developed them so completely and elegantly in his papers that they are still cited as prime references up to half a century later. However, three of his earliest papers are cited rarely, if ever. These include material from his doctoral dissertation. They were written in German, and two of them were published in relatively obscure series. Rather than reprint the original articles, we have chosen to have them translated into English. These translations appear in this book, making Wassily's earliest research available to a wide audience for the first time. All other articles (including those of his contributions to Mathematical Reviews which go beyond a simple reporting of contents of articles) have been reproduced as they appeared, together with annotations and corrections made by Wassily on some private copies of his papers. Preceding these articles are three review papers which discuss the impact of his work in some of the areas where he made major contributions.

Balance of Intrigue

International Rivalry in Korea & Manchuria, 1884-1899

Simultaneous Statistical Inference

Springer Science & Business Media Simultaneous Statistical Inference, which was published originally in 1966 by McGraw-Hill Book Company, went out of print in 1973. Since then, it has been available from University Microfilms International in xerox form. With this new edition Springer-Verlag has republished the original edition along with my review article on multiple comparisons from the December 1977 issue of the Journal of the American Statistical Association. This review article covered developments in the field from 1966 through 1976. A few minor typographical errors in the original edition have been corrected in this new edition. A new table of critical points for the studentized maximum modulus is included in this second edition as an addendum. The original edition included the table by K. C. S. Pillai and K. V. Ramachandran, which was meager but the best available at the time. This edition contains the table published in Biometrika in 1971 by G. I. Hahn and R. W. Hendrickson, which is far more comprehensive and therefore more useful. The typing was ably handled by Wanda Edminster for the review article and Karola Declve for the changes for the second edition. My wife, Barbara, again cheerfully assisted in the proofreading. Fred Leone kindly granted permission from the American Statistical Association to

reproduce my review article. Also, Gerald Hahn, Richard Hendrickson, and, for *Biometrika*, David Cox graciously granted permission to reproduce the new table of the studentized maximum modulus. The work in preparing the review article was partially supported by NIH Grant ROI GM21215.

A House Full of Daughters

A Memoir of Seven Generations

Farrar, Straus and Giroux A family memoir that traces the myths, legends, and secrets of seven generations of remarkable women All families have their myths and legends. For many years Juliet Nicolson accepted hers--the dangerous beauty of her flamenco dancing great-great-grandmother Pepita, the flirty manipulation of her great-grandmother Victoria, the infamous eccentricity of her grandmother Vita Sackville-West, her mother's Tory-conventional background. But then Juliet, a distinguished historian, started to question. As she did so, she sifted fact from fiction, uncovering details and secrets long held just out of sight. *A House Full of Daughters* takes us through seven generations of women. In the nineteenth-century slums of Malaga, the salons of fin-de-siecle Washington D.C., an English boarding school during the Second World War, Chelsea in the 1960s, the knife-edge that was New York City in the 1980s, these women emerge for Juliet as people in their own right, but also as part of who she is and where she has come from. *A House Full of Daughters* is one woman's investigation into the nature of family, memory, and the past. As Juliet finds uncomfortable patterns reflected in these distant and more recent versions of herself, she realizes her challenge is to embrace the good and reject the hazards that have trapped past generations.

Asymptotic Methods in Statistical Decision Theory

Springer Science & Business Media This book grew out of lectures delivered at the University of California, Berkeley, over many years. The subject is a part of asymptotics in statistics, organized around a few central ideas. The presentation proceeds from the general to the particular since this seemed the best way to emphasize the basic concepts. The reader is expected to have been exposed to statistical thinking and methodology, as expounded for instance in the book by H. Cramer [1946] or the more recent text by P. Bickel and K. Doksum [1977]. Another possibility, closer to the present in spirit, is Ferguson [1967]. Otherwise the reader is expected to possess some mathematical maturity, but not really a great deal of detailed mathematical knowledge. Very few mathematical objects are used; their assumed properties are simple; the results are almost always immediate consequences of the definitions. Some objects, such as vector lattices, may not have been included in the standard background of a student of statistics. For these we have provided a summary of relevant facts in the Appendix. The basic structures in the whole affair are systems that Blackwell called "experiments" and "transitions" between them. An "experiment" is a mathematical abstraction intended to describe the basic features of an observational process if that process is contemplated in advance of its implementation. Typically, an experiment consists of a set E of theories about what may happen in the observational process.

Sequential Tests of Statistical Hypotheses

The purpose of this book is to give a systematic account of the mathematical theory in this field as applied to problems of hypothesis testing. The resulting methods are predominantly sequential probability ratio tests. A brief account of classical tests under the Neyman-Pearson formulation is included. The notion of sequential analysis has been used in some form or other in various branches of statistical inference. We may classify these branches into three broad categories: Statistical tests of hypotheses, statistical estimation, and statistical decision theory.

The Great Silence

Britain from the Shadow of the First World War to the Dawn of the Jazz Age

Open Road + Grove/Atlantic This account of British life in the wake of World War I is "social history at its very best . . . insightful and utterly absorbing" (Minneapolis Star-Tribune). As the euphoria of Armistice Day in 1918 quickly subsided, there was no denying the carnage that the Great War had left in its wake. Grief and shock overwhelmed the psyche of the British people—but from their despair, new life would slowly emerge. For veterans with faces demolished in the trenches, surgeon Harold Gillies brings hope with his miraculous skin-grafting procedure. Women win the vote, skirt hems leap, and Brits forget their troubles at packed dance halls. And two years later, the remains of a nameless combatant would be laid to rest in the Tomb of the Unknown Soldier at Westminster Abbey, as "The Great Silence," observed in memory of the countless dead, halted citizens in silent reverence. This history of two transformative years in the life of a nation features countless characters, from an aging butler to a pair of newlyweds, from the Prince of Wales to T.E. Lawrence, the real-life Lawrence of Arabia. The Great Silence depicts a nation fighting the forces that threaten to tear it apart and discovering the common bonds that hold it together. "A pearl of anecdotal history, *The Great Silence* is a satisfying companion to major studies of World War I and its aftermath . . . as Nicolson proceeds through the familiar stages of grief—denial, anger and acceptance—she gives you a deeper understanding of not only this brief period, but also how war's sacrifices don't end after the fighting stops." —The Seattle Times "It may make you cry." —The Boston Globe

The Treasurers of Athena

Presents the Atlantic Oceanographic and Meteorological Laboratory (AOML) in Miami, Florida, one of the Environmental Research Laboratories of the U.S. National Oceanic and Atmospheric Administration (NOAA). Explains that the AOML conducts research in oceanography, tropical meteorology, atmospheric and oceanic chemistry, and acoustics.

The National Archives of the United States

Asymptotics in Statistics

Some Basic Concepts

Springer Science & Business Media This is the second edition of a coherent introduction to the subject of asymptotic statistics as it has developed over the past 50 years. It differs from the first edition in that it is now more 'reader friendly' and also includes a new chapter on Gaussian and Poisson experiments, reflecting their growing role in the field. Most of the subsequent chapters have been entirely rewritten and the nonparametrics of Chapter 7 have been amplified. The volume is not intended to replace monographs on specialized subjects, but will help to place them in a coherent perspective. It thus represents a link between traditional material - such as maximum likelihood, and Wald's Theory of Statistical Decision Functions -- together with comparison and distances for experiments. Much of the material has been taught in a second year graduate course at Berkeley for 30 years.

Theory of Statistical Experiments

Springer Science & Business Media By a statistical experiment we mean the procedure of drawing a sample with the intention of making a decision. The sample values are to be regarded as the values of a random variable defined on some measurable space, and the decisions made are to be functions of this random variable. Although the roots of this notion of statistical experiment extend back nearly two hundred years, the formal treatment, which involves a description of the possible decision procedures and a conscious attempt to control errors, is of much more recent origin. Building upon the work of R. A. Fisher, J. Neyman and E. S. Pearson formalized many decision problems associated with the testing of hypotheses. Later A. Wald gave the first completely general formulation of the problem of statistical experimentation and the associated decision theory. These achievements rested upon the fortunate fact that the foundations of probability had by then been laid bare, for it appears to be necessary that any such quantitative theory of statistics be based upon probability theory. The present state of this theory has benefited greatly from contributions by D. Blackwell and L. LeCam whose fundamental articles expanded the mathematical theory of statistical experiments into the field of comparison of experiments. This will be the main motivation for the approach to the subject taken in this book.

Point Processes and Queues

Martingale Dynamics

Springer From the Introduction: "The emphasis has been placed on topics of interest in systems science at large...The level of exposition and the inclusion of a large number of exercises with complete detailed solutions make this book usable as a text for graduate students in applied probability, electrical engineering, computer science, and operations research. The prerequisites in probability and random processes are recalled in the Appendices."

Computing in Statistical Science through APL

Springer Science & Business Media At the terminal seated, the answering tone: pond and temple bell. ODAY as in the past, statistical method is profoundly affected by T resources for numerical calculation and visual display. The main line of development of statistical methodology during the first half of this century was conditioned by, and attuned to, the mechanical desk calculator. Now statisticians may use electronic computers of various kinds in various modes, and the character of statistical science has changed accordingly. Some, but not all, modes of modern computation have a flexibility and immediacy reminiscent of the desk calculator. They preserve the virtues of the desk calculator, while immensely exceeding its scope. Prominent among these is the computer language and conversational computing system known by the initials APL. This book is addressed to statisticians. Its first aim is to interest them in using APL in their work-for statistical analysis of data, for numerical support of theoretical studies, for simulation of random processes. In Part A the language is described and illustrated with short examples of statistical calculations. Part B, presenting some more extended examples of statistical analysis of data, has also the further aim of suggesting the interplay of computing and theory that must surely henceforth be typical of the development of statistical science.

Contributions to Statistics

Elsevier Contributions to Statistics focuses on the processes, methodologies, and approaches involved in statistics. The book is presented to Professor P. C. Mahalanobis on the occasion of his 70th birthday. The selection first offers information on the recovery of ancillary information and combinatorial properties of partially balanced designs and association schemes. Discussions focus on combinatorial applications of the algebra of association matrices, sample size analogy, association matrices and the algebra of association schemes, and conceptual statistical experiments. The book then examines lattice sampling by means of Lahiri's sampling scheme; contributions of interpenetrating networks of samples; and apparently unconnected problems encountered in sampling work. The publication takes a look at screening processes, place of the design of experiments in the logic of scientific inference, and rarefaction. Topics include mathematical probability, scientific experience, combinatorial progress, gains and losses, criterion and scores, simple drug screening process, and screening of crop varieties. The manuscript then reviews the estimation and interpretation of gross differences and the simple response variance; partially balanced asymmetrical factorial designs; and approximation of distributions of sums of independent summands by infinitely divisible distributions. The selection is a dependable reference for statisticians and researchers interested in the processes, methodologies, and approaches employed in statistics.

Applied Bayesian and Classical Inference

The Case of The Federalist Papers

Springer Science & Business Media The new version has two additions. First, at the suggestion of Stephen Stigler I we have replaced the Table of Contents by what he calls an Analytic Table of Contents. Following the title of each section or subsection is a description of the content of the section. This material helps the reader in several ways, for example: by giving a synopsis of the book, by explaining where the various data tables are and what they deal with, by telling what theory is described where. We did several distinct full studies for the Federalist papers as well as many minor side studies. Some or all may offer information both to the applied and the theoretical reader. We therefore try to give in this Contents more than the few cryptic words in a section heading to speed readers in finding what they want. Second, we have prepared an extra chapter dealing with authorship work published from about 1969 to 1983. Although a chapter cannot comprehensively cover a field where many books now appear, it can mention most of the book-length works and the main thread of authorship studies published in English. We found biblical authorship studies so extensive and complicated that we thought it worthwhile to indicate some papers that would bring out the controversies that are taking place. We hope we have given the flavor of developments over the 15 years mentioned. We have also corrected a few typographical errors.

Man and Metals

A History of Mining in Relation to the Development of Civilization ...

Statistics in Psychology

An Historical Perspective

Psychology Press This book presents an historical overview of the field--from its development to the present--at an accessible mathematical level. This edition features two new chapters--one on factor analysis and the other on the rise of ANOVA usage in psychological research. Written for psychology, as well as other social science students, this book introduces the major personalities and their roles in the development of the field. It provides insight into the disciplines of statistics and experimental design through the examination of the character of its founders and the nature of their views, which were sometimes personal and ideological, rather than objective and scientific. It motivates further study by illustrating the human component of this field, adding dimension to an area that is typically very technical. Intended for advanced undergraduate and/or graduate students in psychology and other social sciences, this book will also be of interest to instructors and/or researchers interested in the origins of this omnipresent discipline.

Portrait of a Marriage

Vita Sackville-West and Harold Nicolson

University of Chicago Press Vita Sackville-West, novelist, poet, and biographer, is best known as the friend of Virginia Woolf, who transformed her into an androgynous time-traveler in Orlando. The story of her love affair with Violet Keppel Trefusis in 1920 is one of intrigue and bewilderment. In Portrait of a Marriage, Nigel Nicolson combines his mother's vivid memoir of escapade with what he learned from copious family letters and explains the context of this romantic crisis. He also describes how Vita Sackville-West and Harold Nicolson went on to live the rest of their lives in harmonious marriage.

ARCH Models and Financial Applications

Springer Science & Business Media ARCH models provide an appropriate framework for studying financial and monetary problems. This book surveys recent work with ARCH models from the perspective of statistical theory, financial models, and applications. Translated from the French edition, new sections on stochastic volatility and time deformation have been added. The book will be suitable for readers with a background in econometrics and ARMA modeling.

The Court of Philip IV.

Spain in Decadence

Smoothing Techniques

With Implementation in S

Springer Science & Business Media The author has attempted to present a book that provides a non-technical introduction into the area of non-parametric density and regression function estimation. The application of these methods is discussed in terms of the S computing environment. Smoothing in high dimensions faces the problem of data sparseness. A principal feature of smoothing, the averaging of data points in a prescribed neighborhood, is not really practicable in dimensions greater than three if we have just one hundred data points. Additive models provide a way out of this dilemma; but, for their interactivens and recursiveness, they require highly effective algorithms. For this purpose, the method of WARPing (Weighted Averaging using Rounded Points) is described in great detail.

English Men of Science

Their Nature and Nurture

Mathematical Theories of Populations

Demographics, Genetics, and Epidemics

SIAM Mathematical theories of populations have appeared both implicitly and explicitly in many important studies of populations, human populations as well as populations of animals, cells and viruses. They provide a systematic way for studying a population's underlying structure. A basic model in population age structure is studied and then applied, extended and modified, to several population phenomena such as stable age distributions, self-limiting effects, and two-sex populations. Population genetics are studied with special attention to derivation and analysis of a model for a one-locus, two-allele trait in a large randomly mating population. The dynamics of contagious phenomena in a population are studied in the context of epidemic diseases.

The Golden Age of Theoretical Ecology: 1923–1940

Springer Science & Business Media This is the part of any book where the authors usually discuss why they wrote it. We hope, however, that the text will justify itself. In fact, any well-trained ecologist will immediately grasp the significance of these seminal works. We have therefore tried to keep our interpretive comments to a minimum. Students of "modern" theoretical ecology will want to contrast the papers in this collection with their modern derivatives. We believe that those who do so will be surprised, if not amazed, by the ecological sophistication and intellectual power of the earlier works. They will stand as a challenge to those who study them, and we hope, provide a standard for the quality of their work. By presenting this collection of works, most of them not easily available and/or for the first time in English, we hope to help them attain the high level of recognition they deserve. We are also enabling readers not sufficiently familiar with Italian to acquire enough of a background to properly follow the works in French not presented here by including Volterra's "Variazioni e fluttuazioni del numero d' indi vidui in specie animali convi venti" (1927), still available. in the original edition.
